Introduction to Kite

- **Kineo Kite**, or simply **Kite**, is a **commercial** software for solving **motion planning** problems and implementing **new planning algorithms**
- based on software originally developed by **Kineo CAM**, a French company founded in 2000 by researchers of LAAS-CNRS
- Kineo CAM released **KineoWorks**, a platform for automatic motion planning and path planning
- in 2012 Kineo CAM was acquired by **Siemens PLM Software**, that currently sells Kineo Kite as an end-user application based on KineoWorks

Basic features

- fully modular architecture (specialized modules are available for specific applications)
- cross-platform (Linux/Windows)
- static and interactive **collision detections**
- automated collision-free path computation, analyzer and editor
- includes many path planners
- path optimization
- **3D animation** and **movie generation** (avi format)

Compatibility features

- 3D engine based on **OpenGL**
- 3D graphical path and kinematics editor
- **VRML 2** importer
- XML Parser for saving and loading scenes in KXML format
- compatibility with other applications supported by optional modules:
for instance, using CGR Data Importer it is possible to import **CATIA™ files** (a CAD design and prototyping software used in many industrial applications)

An example: automatic assembly and disassembly in production processes

Kineo Collision Detection module (KCD)

Advanced features

- possibility to add new modules developing C++ libraries (**addons**)
- Python scripting for rapid prototyping and testing
- optional Kineo CAM addons provides further features
 - example: Kite Wrapping computes swept volumes of multiple objects along a path and exports volumes to VRML files

Kite for research

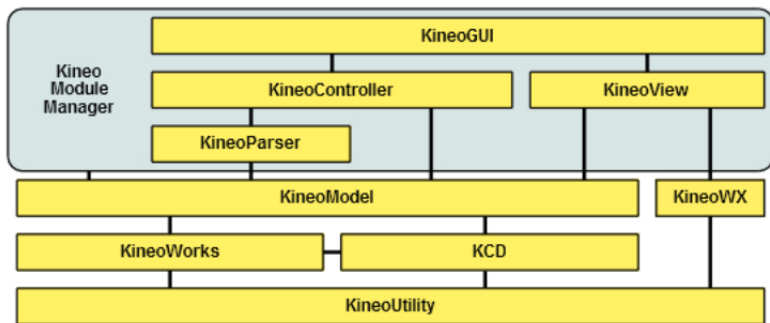

- Kite is distributed under **commercial license**, but allows **academic and no-profit organizations** to do research through the Application Programming Interfaces (API)
- Kite and its APIs together are called **Kite SDK**

Kite SDK architecture (1/2)

- Kite SDK is built on top of **KCD** (the Kineo Collision Detector) and **KineoWorks** (the Kineo path-planning library)
- Kite SDK uses a few design principles that make it quite scalable:
 - **object-oriented** design
 - layered **model-view-controller** (MVC) architecture
 - **smart pointers** for safe and easy memory management
- the Kite SDK Graphical User Interface is built on top of **WxWidgets**, the cross-platform GUI library
- the 3D scene is realized in **OpenGL**

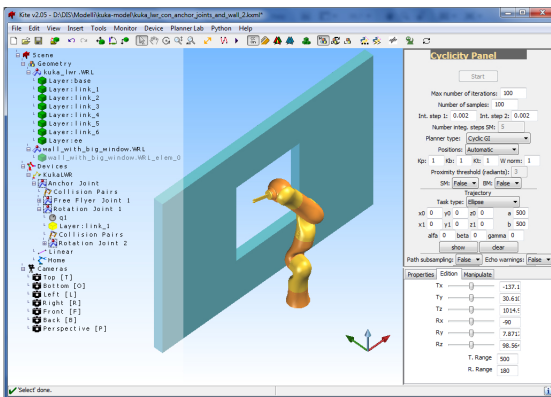

Kite SDK architecture (2/2)

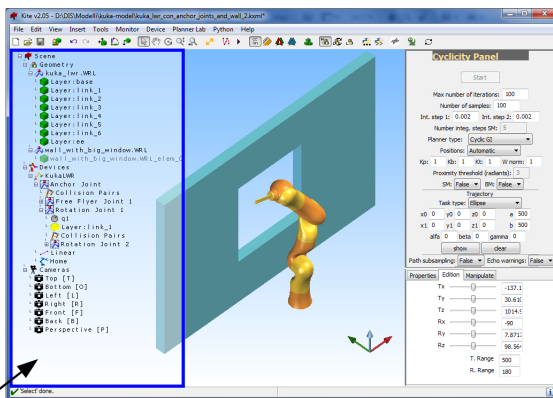

The most important modules are:

- **KineoWorks**: the core Kineo path planning library
- **KCD**: the core Kineo collision detection library

Kite: pros and cons

- + Kite offers a powerful engine for 3D simulations
- + the default distribution provides several path planners
- + can be extended by developing new addons to add numerical solvers and path planners
- + it provides a very efficient collision detection library
- + it is robust and reliable

- the documentation is in some point lacking
- does not cover physics (hence no dynamics, but a new version which manages sensors is being released)
- does not include a numerical solver (but this is typical for kinematics-only frameworks)
- it is not open source: details on the implementation are not known
- no modules to communicate with the physical world
- in Windows, it requires Visual Studio 2005 for developing new addons

Some interesting free alternatives to Kite (1/2)

- BioMove3D (from LAAS-CNRS; <http://www.openrobots.org/wiki/move3d>). The configuration space representation is the core feature of this library. It divides the world between movable articulated objects and static objects
- MPK: Motion Planning Kit (<http://ai.stanford.edu/mitul/mpk/>). It is a C++ library and toolkit for developing single and multi robot motion planners
- Motion Strategy Library: a C++ library for motion planning free for both academic and commercial use (<http://msl.cs.uiuc.edu/msl/>)
- OMPL: the Open Motion Planning Library (<http://www.kavrakilab.org/software>). A C++ library for sampling-based motion planning. OMPL is also integrated in ROS and will be available as a ROS package

Some interesting free alternatives to Kite (2/2)

- **OOPSMP**: an Object-Oriented Programming System for Motion Planning (<http://www.kavrakilab.org/software>). It is still available for download, but is no longer further developed
- **Simox**: a C++ toolbox containing three libraries for 3D simulation of robot systems, sampling based motion planning and grasp planning (<http://simox.sourceforge.net/>)
- **OpenRave**: provides an environment for testing, developing, and deploying motion planning algorithms in real-world robotics applications (<http://openrave.programmingvision.com/>)
- **V-REP**: free, open source and multi-platform; simulates physics and provides ROS connectivity (<http://www.coppeliarobotics.com/>)

V-REP, in particular...

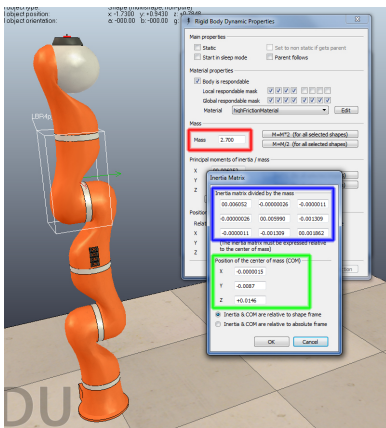

V-REP is a robotic simulator: a software environment aimed at generic robotic applications. With respect to Kite:

- + it is **free** and **open source**
- + it provides engines for **dynamic/physics simulations**
- + it allows the simulation of **sensors**
- + many robot models are available in the standard distribution
- + its functionalities can be extended using many programming languages (C/C++, Python, Java, Lua, MATLAB, Octave, Urbi) and programming approaches (remote clients, plugins, ROS nodes...)
- its collision detection library is less efficient than KCD
- does not provide tools for motion planning : it is a general purpose software environment, not specifically oriented to motion planning

V-REP promises to become a reference platform for prototyping and developing robotics applications.

Dynamic modeling in V-REP

Building a dynamic model in V-REP is very easy: no equations are needed

It requires a few simple steps:

- 1 import a CAD model of the robot
- 2 associate to each body of the robot its dynamic parameters: mass, center of mass, inertia matrix

Dynamic modeling in V-REP

- 3 build a model tree: a tree that represents all hierarchical information of the kinematic chains. It contains bodies and joints
