Why to use this Latex file

All KRDB2001 organizers
in some institutes in Italy, Germany and USA

Abstract

In this paper, we will argue that it is reasonable to use the Latex file "submission.tex" for preparing your camera-ready copy for KRDB2001.

1 Motivation

After reading the review reports we sent to you, you sure want to modify your paper according to the suggestions of the reviewers. And you want to prepare your final version in such a way that it fits nicely into the proceedings.

Using this example file for your camera-ready copy has a big advantages:

1. It will fit nicely into the proceedings.
2. It is almost a standard LaTeX file, so you should be able to use it without any difficulties. The settings of the margins and parameters will allow you to write slightly more text on 8 pages than with the original LaTeX article settings.

2 Technical Details

This example file is not just a simple LaTeX 11-point article style file, but an 11-point, twoside article style file with modified layout. The following parameters have been changed and no other changes to the format should be made.

hoffset	-1in
voffset	-1in
oddsidemargin	3.2cm
evensidemargin	3.3cm
headheight	2.5cm
textwidth	14.3cm
textheight	21.5cm

Table 1: Changed parameters

3 Conclusion

We have argued that there are at least two good reasons to use this example file for submissions to KRDB2001. Apart from the layout, feel free to make changes in this file and to use packages for graphics, theorems, tables, etc.
